Anderson Nascimento

Senior Full-Stack Engineer (AI/LLM)

andersonsantss99@gmail.com +55 32 991448805
https://www.linkedin.com/in/anderson-nascimento-b47255438/ Minas Gerais, Brazil

Summary

Full-stack engineer, nine years, working in Python with Go and Java on the server and React and TypeScript on the front. Recent work is payments infrastructure: cross-border disbursements, an event-sourced ledger, and provider integrations on Postgres, Redis, and Kafka in AWS. Before that, four years contracting with Thoughtworks on commerce services, and a first job on clinical scheduling.

Professional Experience

AI Trainer/LLM Evaluator (Freelance)

May 2023 – Present

Remote

- Evaluate model output on software-engineering tasks (Python, Go, Java, API design, debugging), ranking correctness, edge-case handling, and maintainability, and documenting recurring failure patterns.
- Performed prompt-based testing and model comparison using software-engineering scenarios, with particular attention to Python, Java, Go, APIs, backend architecture, debugging, and code quality.
- Assessed generated code and technical explanations for functional correctness, edge cases, maintainability, security considerations, and alignment with user requirements.
- Supported AI training workflows through data annotation, preference labeling, and human-feedback processes, documenting model weaknesses and recurring failure patterns.
- Analyzed LLM behavior across coding and backend-development tasks and provided actionable evaluation notes to improve model performance and usefulness for professional engineering workflows.

Infisical, *Senior Full-Stack Engineer*

Aug 2023 – Present

San Francisco, US · Remote

- Designed a cross-border contractor payout platform on idempotent state machines and the outbox pattern. Disbursements cross provider boundaries where a timeout tells you nothing about whether money moved, so every transition had to be replayable without double-paying, across multiple currencies and payout corridors.
- Rebuilt contractor onboarding as an event-driven Kafka pipeline, replacing blocking third-party KYC/KYB calls that held a request open for the length of the slowest vendor. Completion went from about 9 minutes to under 2, which took onboarding off the list of things support fielded complaints about.
- Ran payment workloads on multi-region Postgres and Redis (RDS, ElastiCache) with PgBouncer in transaction mode, which kept connection counts flat as traffic grew.
- Wrote an internal provider SDK wrapping Stripe, Wise, Adyen, and Brex behind one interface. Four vendors with four retry semantics and four failure vocabularies, collapsed into shared circuit-breaker and tracing behavior so adding the next one took days instead of weeks.
- Rebuilt the payment ledger as append-only Postgres with event sourcing, making it the system of record for SOC 2 audit evidence and ending the reconciliation guesswork that came with mutable balance rows.
- Built the product's LLM features end to end: provider API integration, RAG over internal docs with vector search, and the React interface consuming streamed responses.
- Carried on-call for the payments services and fixed the recurring pages rather than re-triaging them.

Thoughtworks, *Full-Stack developer*

Jun 2019 – Jul 2023

Chicago, US · Remote

- Built REST APIs and Celery background jobs in Flask for a client's catalog and merchandising services, backed by Postgres and Redis, on a distributed squad pairing daily with the US team.
- Built the React and TypeScript catalog management screens against those APIs, including the long-running job views that let merchandisers track operations without blocking on them.

- Took test coverage on two recommendation services from 45% to over 85% with pytest and HTTPX, which surfaced bugs in code paths nobody had exercised since launch and made daily deploys safe enough to actually do.
- Tracked down a production cache stampede where every expiry sent the same flood of requests to Postgres, and fixed it with staggered TTLs and single-flight locking.
- Moved the team's CI from Jenkins to GitLab CI, folding tests, frontend builds, and container creation into pipeline config so every service on the team built the same way.

CI&T, *Junior Full-Stack developer* Aug 2017 – May 2019
São Paulo, Brazil · Onsite

- Built booking and availability APIs for a clinic appointment-scheduling service in Python, backed by Postgres and Redis.
- Fixed double-booking under concurrent reservations using Postgres row locks with short-lived Redis holds on a slot while the booking was in flight, the failure mode that generates support calls and lost appointments.
- Built the patient-facing booking and availability screens, including the error states around reservation conflicts.

Education

University of Toronto
Toronto, Canada

Master's degree in Computer Science Sep 2015 – Jul 2017

Bachelor's degree in Computer Science Sep 2011 – Jun 2015

Skills

Languages: Python, Go, Java, TypeScript, JavaScript, SQL

Frontend: React, JavaScript, TypeScript, HTML, CSS

Backend: FastAPI, Django, Flask, Spring Boot, REST, gRPC, GraphQL

AI / LLM: OpenAI API, Claude API, RAG, Pinecone, Weaviate

Data & Messaging: PostgreSQL, MongoDB, Redis, Kafka, Celery, SQS

Cloud & Infrastructure: AWS, Docker, Kubernetes, Terraform

Observability & SRE: Datadog APM, OpenTelemetry, PagerDuty, k6

Security: SOC 2, AWS KMS, OAuth

Languages

Portuguese Native English C2

Certificates

AWS Certified Developer AWS Aug 2025

Certified Kubernetes Application Developer CNCF Jan 2026
